

Max Leone

SOFTWARE ENGINEER | XR AND GAME ENGINES

Fort Collins, CO | [LinkedIn](#) | [GitHub](#)

SUMMARY

Software engineer with 10+ years of experience across XR platforms, game engines, and test infrastructure. I enjoy creative technical challenges and turning ideas into working software. I work well independently or with small teams, staying hands-on from early exploration through delivery.

TECHNICAL FOCUS

- Software engineering, technical prototyping, and developer-facing tools
- XR platforms and integrations: Android XR, OpenXR, Unity, Unreal Engine, Godot, and Magic Leap SDKs
- Languages: Python, C#, and C/C++
- Source control and code review: Git, Gerrit, and the Android repo tool
- Test infrastructure: CI/CD, Jenkins, Pytest, Mobly, and emulator automation
- Cross-layer debugging, diagnostic applications, and performance analysis
- Technical leadership, systems thinking, and cross-functional engineering

EXPERIENCE

Magic Leap / Google Assignment

Senior Software Engineer - Android XR Platform Testing

February 2025 - October 2026 | Official title: Principal Software Engineer

- Implemented a Python/Mobly framework that uncovered Android XR emulator issues not found through manual testing.
- Configured CI/CD test pipelines that increased test frequency and coverage across Android XR emulator build combinations.
- Authored an AI-assisted triage workflow that sped up bug resolution through faster reporting and better routing.

Software Test Engineering Team Lead - Unity and Unreal Engine Integrations

2017 - February 2025 | Functional roles included technical lead and senior software/test engineer; official titles varied over time

- Built diagnostic apps that identified the source of issues across the XR stack, leading to faster fixes by the responsible teams.
- Consolidated Unity/Unreal test teams around shared test app designs and aligned suites, reducing bug noise while ensuring feature parity.
- Integrated testing into feature development, verifying requirements early and reducing last-minute validation before release.
- Created a shared test suite model for Unity/Unreal, eliminating duplicate maintenance of shared feature cases.
- Configured Jenkins pipelines to build required test apps for Unity and Unreal, enabling new tests while reducing build times for more efficient releases.

SDSol Technologies

Junior Software Engineer / QA Engineer

August 2013 - August 2014

- Designed and executed software testing plans, facilitated coordination between QA and engineering, and worked with product owners to apply practical, cost-effective delivery practices.

PROJECT HIGHLIGHTS

Traffic Simulator - [FIU project page](#)

FIU Capstone Project | 2017

- Built the Unity simulation and visualization application for a cross-disciplinary traffic-routing study, integrating and visualizing the routing algorithm developed through the research project.
- Implemented controlled and large-scale map modes to compare the research algorithm with Dijkstra's algorithm and visualize traffic bottlenecks and overall traffic-flow differences. [Project walkthrough video](#)
- Also built a browser-based simulator with Leaflet, MapQuest, GeoJSON street data, and a custom routing API to create vehicle simulations, visualize returned paths, and report algorithm performance.

Elsie - [Steam](#)

Knight Shift Games | Early development, 2015 - 2017

- Collaborated on early game design, prototyping, and implementation for a roguelite action-platformer, contributing enemy AI, character controllers, procedural level generation, visual effects, playtesting, balancing, and bug fixes.
- Built a custom chain-lightning particle system and Unity editor tooling for configuration; the system carried into the publicly released game.

EDUCATION

B.S. in Computer Science, Florida International University - 2016
