

Max Leone

SOFTWARE ENGINEER | XR, GAME ENGINES, AND TECHNICAL PROTOTYPING

Fort Collins, CO | [LinkedIn](#) | [GitHub](#)

SUMMARY

Software engineer and technical creator with 10+ years of experience across XR platforms, SDKs, Unity and Unreal Engine integrations, test infrastructure, simulations, and game development. I enjoy understanding difficult systems and turning ideas into working software across XR, game engines, and creative prototypes. I am most effective in hands-on, collaborative environments where I can understand the underlying system, create a practical solution, and carry it through implementation and verification.

TECHNICAL FOCUS

- Software engineering, technical prototyping, and developer-facing tools
- XR platforms and integrations: Android XR, OpenXR, Unity, Unreal Engine, Godot, and Magic Leap SDKs
- Languages: Python, C#, and C/C++
- Source control and code review: Git, Gerrit, and the Android repo tool
- Test infrastructure: CI/CD, Jenkins, Pytest, Mobly, and emulator automation
- Cross-layer debugging, diagnostic applications, and performance analysis
- Technical leadership, systems thinking, and cross-functional engineering

EXPERIENCE

Magic Leap / Google Assignment

Senior Software Engineer - Android XR Platform Testing

February 2025 - Present | Official title: Principal Software Engineer

- Contributed across planning, architecture, implementation, testing, and analysis of local and CI results for a Python/Mobly automation framework and CI/CD pipeline targeting Android XR emulators.
- Implemented components for emulator lifecycle management, system-image installation, local repository setup, and build/test configuration, enabling repeatable provisioning and CI validation across build targets.
- Analyzed local and CI failures and authored an AI-assisted triage workflow with reusable prompt guidance, cross-target failure queries, and an end-to-end bug-reporting process later adopted by the team.

Software Test Engineering Team Lead - Unity and Unreal Engine Integrations

2017 - February 2025 | Functional roles included technical lead and senior software/test engineer; official titles varied over time

- Served as a Unity subject-matter expert and later expanded into Unreal and MRTK, building diagnostic test applications and detailed bug reports that traced issues across platform, SDK, native OpenXR, and engine integration layers.
- Led a joint Unity and Unreal test team in a hands-on technical leadership capacity, coordinating planning, delegation, requirement refinement, technical discussions, release testing, cross-team communication, and final release-result signoff.
- Helped put a shift-left testing process into practice by leading requirement-refinement meetings, drafting test cases and suite scaffolding, and delegating requirement-level coverage so issues could be identified earlier in development.
- Designed a feature-oriented test model that created a shared reference for platform behavior across Unity, Unreal, native C API, and native OpenXR suites while keeping engine-specific integration details separate.
- Worked with Build and Release teams on Jenkins pipelines to improve release artifact organization and ensure required test applications were built and available for QA validation.

SDSoI Technologies

Junior Software Engineer / QA Engineer

August 2013 - August 2014

- Designed and executed software testing plans, facilitated coordination between QA and engineering, and worked with product owners to apply practical, cost-effective delivery practices.

SELECTED PROJECTS

Traffic Simulator - [FIU project page](#)

FIU Capstone Project | 2017

- Built the Unity simulation and visualization application for a cross-disciplinary traffic-routing study, integrating and visualizing the routing algorithm developed through the research project.
- Implemented controlled and large-scale map modes to compare the research algorithm with Dijkstra's algorithm and visualize traffic bottlenecks and overall traffic-flow differences. [Project walkthrough video](#)
- Also built a browser-based simulator with Leaflet, MapQuest, GeoJSON street data, and a custom routing API to create vehicle simulations, visualize returned paths, and report algorithm performance.

Elsie - [Steam](#)

Knight Shift Games | Early development, 2015 - 2017

- Collaborated on early game design, prototyping, and implementation for a roguelite action-platformer, contributing enemy AI, character controllers, procedural level generation, visual effects, playtesting, balancing, and bug fixes.
- Built a custom chain-lightning particle system and Unity editor tooling for configuration; the system carried into the publicly released game.

EDUCATION

B.S. in Computer Science, Florida International University - 2016
